

# EPUB2596 - Fix Custom Page .asp

EPUB2596 was an issue that came up after version 2024.1 was initially released that caused search highlighting to fail in Reverb 2.0.

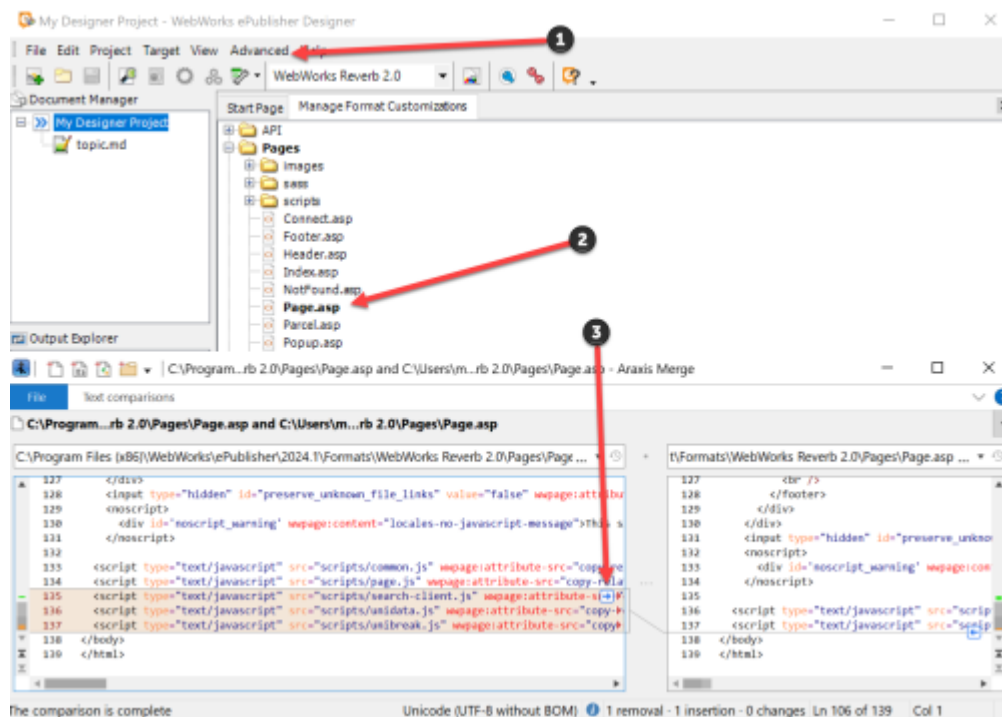

## Does this affect you?

If the answer is **Yes** to all of the following questions, then this solution affects you.

- Was your project's target output format: *WebWorks Reverb 2.0*?
- Does your project have a customization for Page .asp?
- Was this done using build *2024.1.4577* or earlier?
- Was your project using base format version: *2024.1*?

## Steps to migrate your custom `Page.asp`

1. In your Designer project, select the menu **Advanced > Manage Format Customizations** or **Manage Target Customizations**
2. Locate `Page.asp` underneath `Pages/scripts`. It should be in bold. If not, then it is not customized and this technical note does not apply to you. Right-click `Page.asp` and select **View File Differences**
  - Note: you can edit the file directly, but viewing the differences is simpler and less error prone.
3. See image below to insert the missing lines into your custom `Page.asp` file.

Lines to insert are:

```
<script type="text/javascript" src="scripts/search-client.js"
  wwpage:attribute-src="copy-relative-to-output-root"></script>

<script type="text/javascript" src="scripts/unidata.js"
  wwpage:attribute-src="copy-relative-to-output-root"></script>

<script type="text/javascript" src="scripts/unibreak.js"
  wwpage:attribute-src="copy-relative-to-output-root"></script>
```
